Publications

2. Awaya J, Fox PM and Borthakur D (2003) Genes encoding a fructose-1,6-bisphosphate aldolase and a fructose-1,6-bisphosphatase are present within the gene cluster for mimosine degradation in Rhizobium sp. strain TAL1145. Plant Soil 257: 11-18.
3. Awaya J, Walton C and Borthakur D. The pydA-pydB fusion gene produces an active dioxygenase-hydrolase protein in Rhizobium and Escherichia coli that degrades 3-hydroxy-4-pyridone, an intermediate of mimosine metabolism (manuscript in preparation).

Future plan

Postdoctoral research at Notre Dame starting on February 1, 2006
ABSTRACT

Mimosine and 3-hydroxy-4-pyridone (HP) are toxic aromatic compounds produced in tree-legume leucaena (*Leucaena leucocephala*). These can be degraded by some leucaena-nodulating *Rhizobium* strains, such as TAL1145. Previously, a cosmid clone, pUHR263, containing the *mid* and *pyd* genes for mimosine and HP degradation, was isolated from a clone library of TAL1145. The aim of this project was to identify genes for mimosine and HP degradation in pUHR263 and determine their functions. Mimosine degradation by *Rhizobium* involves at least two major steps; in the first step mimosine is degraded to HP, which is then converted to pyruvate, formate and ammonia in the second step. Two structural genes, *pydA* and *pydB*, encode a *meta*-cleavage dioxygenase and a hydrolase, respectively. *pydA* and *pydB* are required for degradation of HP, and *pydC, pydD*, and *pydE* encode proteins of an ABC-transport system involved in the uptake of HP by TAL1145. *pydA, pydB, pydC, pydD*, and *pydE* are induced by HP, although *pydA* and *pydB* show low levels of expression in the absence of HP. *pydA* and *pydB* are cotranscribed while *pydC, pydD*, and *pydE* are each transcribed from separate promoters. *pydR* is located upstream of the *pyd* genes and encodes a transcriptional regulator for the activation of *pydA* and *pydB* in the presence of HP. Elucidation of the HP degradation pathway in *Rhizobium sp.* strain TAL1145 may provide a useful strategy to genetically engineer leucaena and rhizosphere bacteria to disrupt the biosynthesis of mimosine and for bioremediation of aromatic toxins, respectively.
